Joshua Pucket

The ERD in Boyce-Codd Normal Form (BCNF) normalized form is (Description in the Appendix):

SCHEMA FORMAT V2 (NORMALIZED I USED **TABLE NAMES** instead of generic **RELATIONS**) EX:

R(A,B,C,D) { **A** -> BCD , BC -> **AD** , D -> B } --FUNCTIONAL DEPENDENCY

```
-- SCHEMAS in THE REQUESTED FORMAT
-- "RELATION_NAME(PrimaryKey, OtherColumn1, OtherColumn2,ForeignKey1)"

BOOK(ISBN , Title ,Genre Rating , Format ,NumberOfCopies ,Publisher , Author)
PATRON( CardNumber ,Name ,Active , PhoneNumber , Email , HasOverdue)
ORDER_TBL(OrderID ,DateRequested , CardNumber ,DueDate , PastDue , ISBN )

NEWBOOKREQUEST(NewBookISBN ,Title ,Genre ,Filled ,DateRequested , CardNumber)
PATRON_NEWBOOKREQUEST(Card_Number , NewBookISBN)

BOOK_REVIEW( RatingID , RATING , CustomerID , ISBN)

Blue = Foreign Key
RED = Primary Key
```

CREATE TABLES STATEMENTS:

<http://34.150.201.142/team02/PROJECT/SQL/CREATE%20TABLES.TXT>

INSERT DATA (2 working ways, SQL is easier than CSV):

A. We have SQL/TEXT file prepared:

<http://34.150.201.142/team02/PROJECT/SQL/>

<http://34.150.201.142/team02/PROJECT/SQL/INSERT%20STATEMENTS.txt>

B. We have CSV file prepared:

<http://34.150.201.142/team02/PROJECT/CSV/>

IMPORT DATA (CSV) STATEMENTS:

--IN CASE YOU NEED THE CODE:

LOAD DATA INFILE '/location/of/file/tableName.csv'

INTO TABLE \$whatevertableName is

FIELDS TERMINATED BY ','

ENCLOSED BY '"'

LINES TERMINATED BY '\n'

IGNORE 1 ROWS; -- to not read the names, just the data

-- WE HAVE "INSERT STATEMENTS" ALSO TO MAKE IT EASIER.

IMPLEMENTED INSIDE THE DATABASE (team02):

APPENDIX:

Sharing the process:

TO RETHINK THE Schema to BCNF Normalized:

1. Book table

- The Book table is in unnormalized form as One author can write more than one books and One Publisher can publish more than one book and More than one books are belongs to one genre. So we have to normalized it to make separate tables for Author, publisher and genre.

1. Book Table

Book (ISBN (PK), Title, Rating, Format, NumberOfCopies, Genre (FK), PublisherID (FK), AuthorID (FK))

2. Author Table

Author (AuthorID (PK), name)

3. Publisher Table

Publisher(PublisherID (PK) , name)

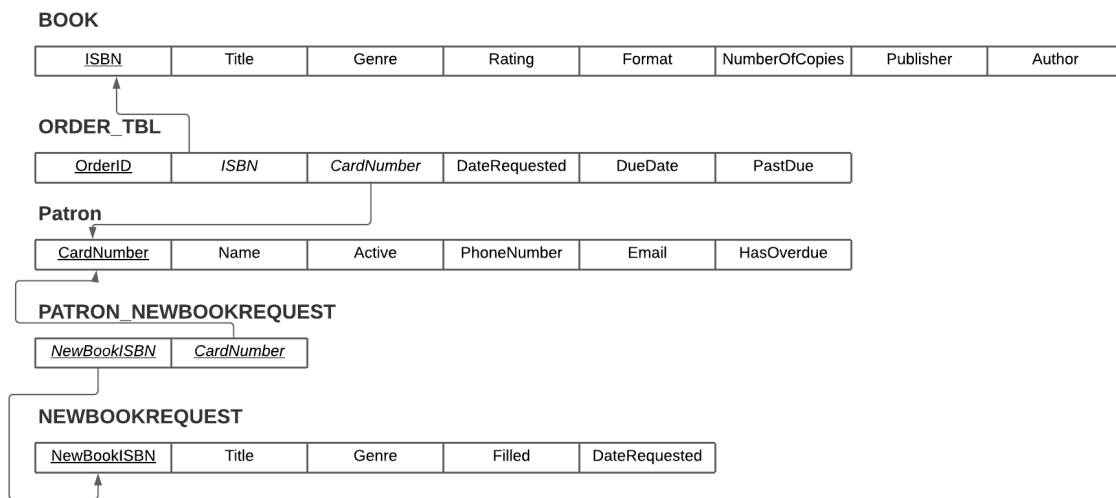

4. Genre Table

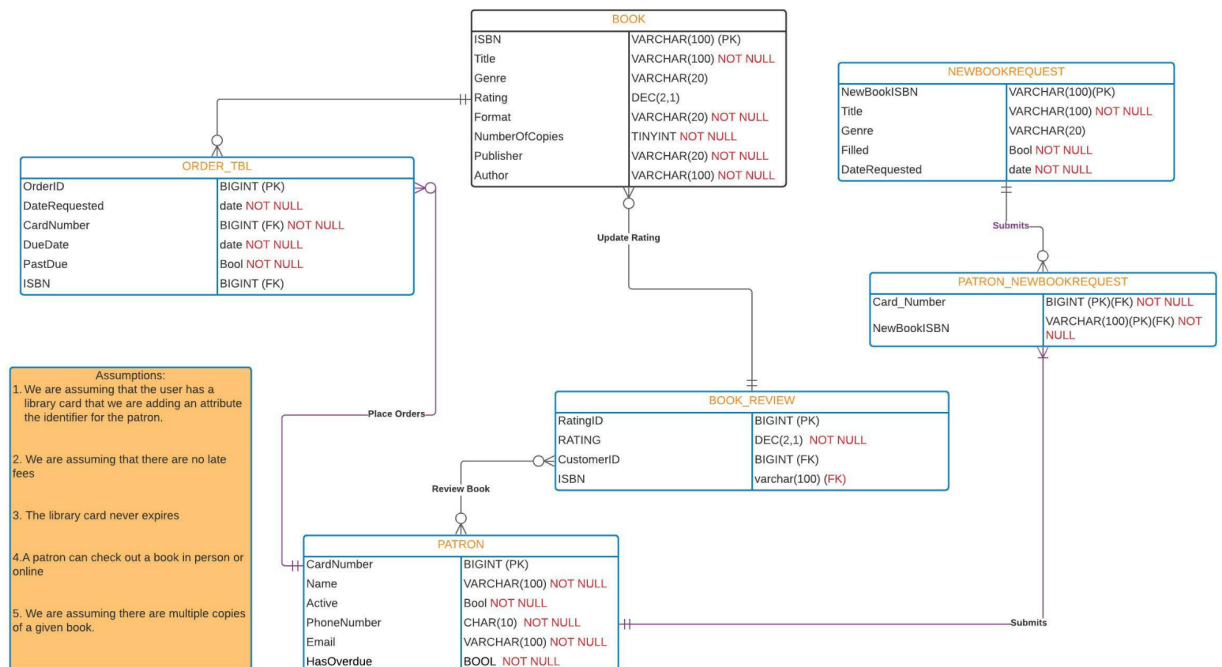

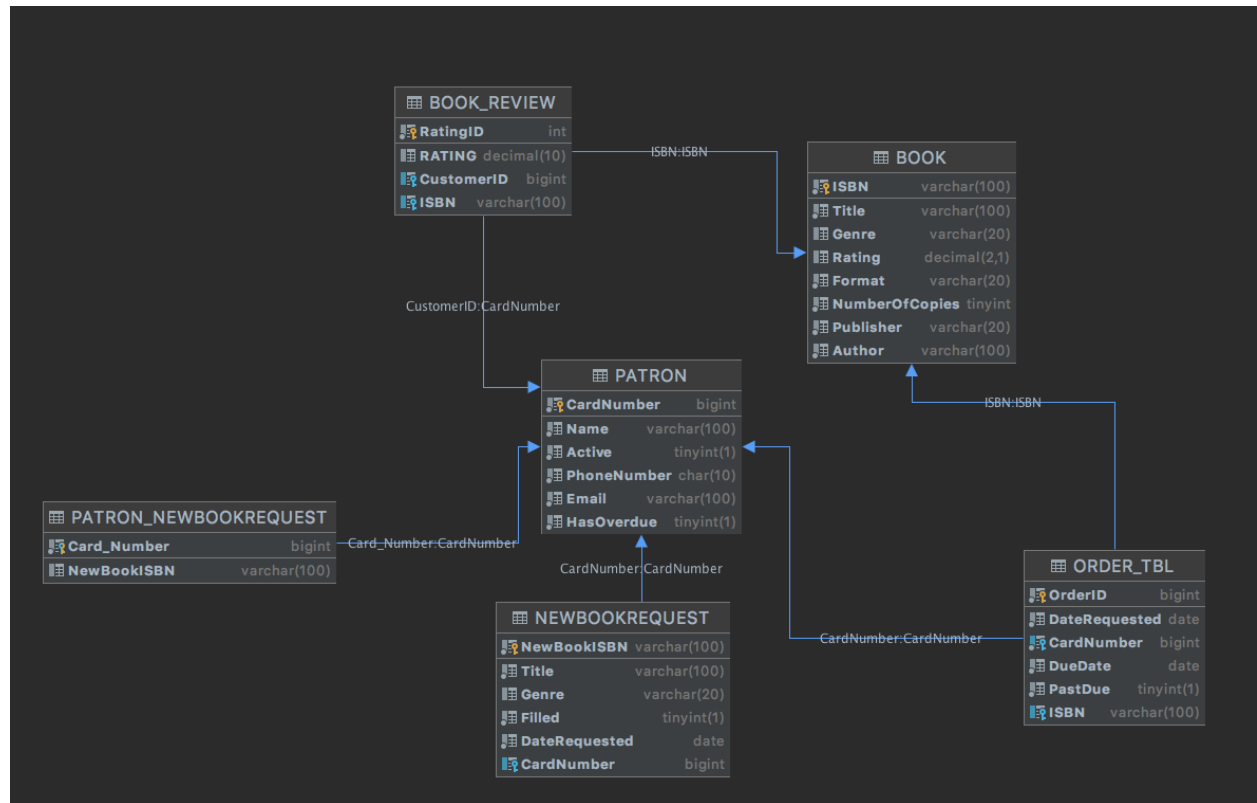

Genre (GenreID (PK)

- 2. The table Patron_newNookRequest and NewBookRequest has duplicate attributes so we can replace this two tables with single request table and remove the duplicate attributes that are already present in Book table.

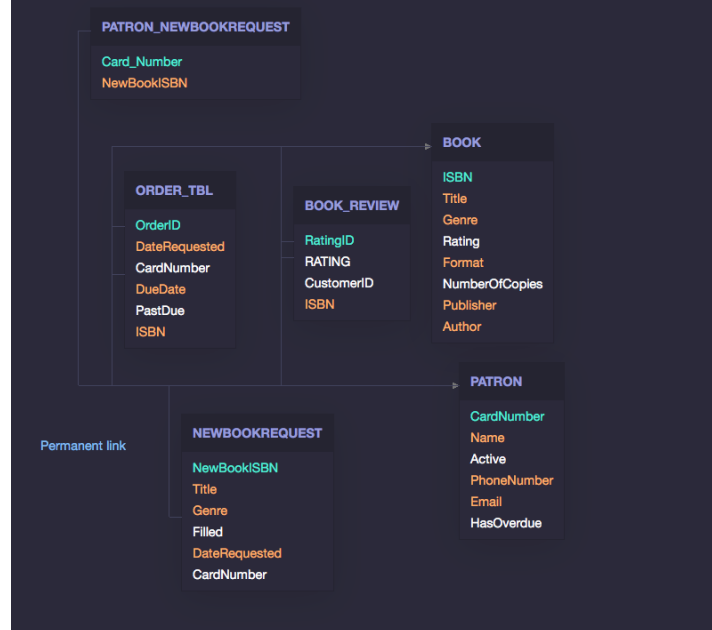

SCHEMA FORMAT V3.:

NOTE: WE CREATED SEVERAL SCHEMA FORMATS TO COVER OUR BASIS

Database schema: team02

NOTE: ALL DATA IS NOW OPERATIONAL ON THE **team02** DB.

Grading:

Assignment Grading

10 points	All database implementation documents are formatted nicely, easy to read, grammatically correct, etc.
15 points	Schema are correctly formatted and match the ERD from your design (integrating any updates based on grading feedback).
15 points	Schema are in BCNF.
20 points	CREATE statements have correct syntax, run without errors, and match the requirements/structure given in your project requirements, design, and implementation documents.
20 points	Schema are created and populated on the server.

IT WORKS perfectly.
100%

IT WORKS perfectly.
100%

I included 6 diagrams. One of them ought to be BCNF

Yes they are because the import statements wouldn't work otherwise

It looks good to me

Bonus: (free DNS) the Apache server doesn't have a SSL Certificate, so HTTPS doesn't matter anyways. You will get an error either way:
